TIME PERIOD

50.3%

AVG ENGAGEMENT RATE

47.5K

TOP CHANNEL USERS

Executive Summary

Traffic isn't the problem — **engagement quality** is. Across 28 days of hourly data, **Organic Social** brings in by far the most visitors, but many of them don't stick around. **Referral** traffic is smaller but far more engaged, and **Direct** traffic loses more people than it keeps. Activity follows a clear daily rhythm, quiet overnight and peaking in the evening, with one standout spike in mid-April worth understanding and repeating.

Key Insights

TRAFFIC

Organic Social drives the most visitors

Organic Social leads with roughly 47.5K users, well ahead of Direct, Organic Search, and Referral, which sit close together at 27K-30K each. Email and Video bring in almost no traffic.

ENGAGEMENT

Referral is the highest-quality traffic

Referral visitors engage the most consistently of any channel — fewer visits wasted, more real interaction.

ENGAGEMENT

Direct traffic underperforms

More Direct visitors leave than actually engage, making it the weakest-converting channel despite decent volume.

VOLUME

Organic Social: high reach, lower quality

It brings in the most people of any channel, but a large share of that traffic doesn't engage once it arrives.

TIMING

Clear daily and event-driven pattern

Traffic is lowest overnight (12-5 AM) and builds to a peak in the evening (6-10 PM). One large spike stands out around April 17-18.

What This Means

The site doesn't have an **awareness** problem — it has a **conversion** problem on its biggest channels. Fixing how Direct and Organic Social visitors are welcomed once they land, while doubling down on what makes Referral traffic work so well, is the fastest path to better results without spending more on acquisition.

Recommendations

1. Fix the Direct traffic experience

Improve landing pages and calls-to-action — this channel currently loses more visitors than it engages.

2. Invest further in Referral partnerships

It's the best-converting channel; strengthening these relationships should pay off more than chasing new volume.

3. Better-match Organic Social content to landing pages

Link posts to relevant, specific pages instead of a generic homepage to convert more of that traffic.

4. Concentrate campaigns in peak hours (6-10 PM)

This is when engagement is naturally highest — the best window for posts, ads, and promotions.

5. Study and try to repeat the April 17-18 spike

Understanding what drove that surge could reveal a repeatable growth lever.

6. Track engagement rate, not just traffic volume

Use it as the primary success metric going forward, alongside testing Email and Video as still-untapped channels.

The Data, Briefly

The raw export had 3,182 hourly rows across 10 metrics (users, sessions, engagement rate, and more) for six traffic channels. Cleaning involved promoting the real header row, converting the date-hour text into proper datetime values, and converting all metric columns from text to numbers. No rows had missing data after cleaning. An "Hour" column was then extracted to support the time-of-day analysis.

A Note for Anyone Reusing the Notebook

The dataset path is hardcoded to a local folder and will need updating to run elsewhere. A few chart titles have small typos worth a quick clean-up pass before sharing the notebook further.
